

OUR PRACTICE

Energy and Petroleum

Baker Donelson has considerable experience in preparing patent applications related to the oil and gas industry and to the energy sector. We have petroleum engineers and mechanical/industrial engineers who are also registered patent attorneys, all of whom have technical experience in the oil and gas industry.

Most notably, we have recently filed a series of patent applications for the world's first system that enables an operator to generate mini-lateral boreholes in controlled directions many hundreds of feet, obviating the need for the current "perf-and-frac" systems that are so prevalent (and controversial) and exponentially increasing the formation face.
